

JUST AUTOS

JA Portal — Standard Operating Procedures

How to use the portal, task by task — for workshop, distributor orders, accounts payable, sales and reporting.

Compiled 20 August 2026 · justautos.app · Internal — not for distribution outside Just Autos

JA Portal — Standard Operating Procedures

How to use the portal, task by task.

Compiled 20 August 2026. Companion to `HANDOVER.md`, which covers how the system is *built*; this document covers how it is *used*. Where the two disagree, the code wins — tell Chris so both get fixed.

Production: `https://justautos.app`

This document lives in the portal at **Admin** → **Library** — read it there, or download the PDF to keep a copy. It is kept up to date as the portal changes, so the copy in the Library is always the current one; a PDF you saved months ago may not be.

How to read this

Each procedure is written as a job you might need to do, in the order you would do it. Screens are named the way they appear in the portal. Anything marked **Δ** is a step where getting it wrong costs money, time, or a customer's confidence — those are worth reading even if you know the rest.

If you only ever read one section, read the one for your own role:

You are	Start at
Parts / workshop support	§3 Workshop tooling
B2B / warehouse	§4 Distributor orders
Accounts payable	§5 Accounts Payable
Sales rep (quote channels)	§6 Quote channels
Manager / director	§8 Reports
Whoever is holding the pager	§10 When something looks wrong

1. Getting in

1.1 Signing in

1. Go to `https://justautos.app`.
2. Sign in with your work email.
3. If you have two-factor turned on, enter the 6-digit code from your authenticator app.

You stay signed in across days — the portal quietly re-syncs your session in the background, so you should not be asked to log in each morning. If you land on a login page while already signed in, it will resume you automatically and send you where you were going.

Lost your 2FA device: an admin clears it from Settings → Users. There is no self-service reset, on purpose.

1.2 Turning on two-factor

Settings → your profile → enable two-factor, scan the QR with your authenticator, confirm with a code. It is opt-in per person. Anyone touching money (AP, B2B refunds, MYOB pushes) should have it on.

1.3 Install it as an app

The portal is installable. In Chrome or Edge, use the install icon in the address bar; on iPhone, Share → Add to Home Screen. You get a normal app icon, full screen, and push notifications.

Portal links open in the app, not a browser tab. Click a portal link in Outlook, Slack or Teams on your computer and it lands in the installed portal app — in the window you already had open, rather than piling up new ones. Those desktop apps hand links to your default browser, and the browser passes anything that belongs to the portal straight to the app.

One switch, once per computer. The first portal link you click after installing may ask whether to open it in the app — say yes and it stops asking. If it never asks and links keep opening in a tab, turn it on directly: open the portal app, click the : menu in its title bar, and tick **Open supported links in this app** (Edge: `edge://apps` → the portal → same setting). Chrome moves this menu around between versions, so if you can't find it, ask Chris rather than assuming it's broken.

Two limits, neither fixable in the portal:

- **iPhone and iPad can't do this at all.** iOS always opens links in Safari, even with the portal on the home screen — an Apple restriction. Open the app from its icon and navigate from there.
- **Links tapped inside a phone app's own browser** (Slack or Gmail on a phone) may never reach Chrome, so they stay in that app's browser.

1.4 Notifications

The bell in the top bar shows portal notifications; tabs show unread badges. Push notifications (the ones that arrive when the portal is closed) need to be allowed once per device when prompted.

1.5 The JA Assistant has been removed

The floating assistant button that used to sit in the bottom-right corner of every page is gone (21 August 2026). It was covering figures on the reports. Nothing else changed, and no data was deleted — if you want it back, ask Chris.

1.6 When a new version ships

A "new version — Reload" banner appears when the portal has been updated underneath you. Finish what you are typing, then reload. ⚠ Don't ignore it for days — you can end up submitting a form the server no longer expects.

1.7 Getting access to something you can't see

The portal hides what you don't have permission for, so a missing tab is normal, not a fault. Ask Chris; access is per-person, per-tab.

2. Finding your way around

- **Home** (`/home`) is the app launcher — every module you have access to, as tiles.
 - The **top bar** carries your tabs: Workshop, Distributors, B2B Portal, AP Invoices, CRM, Phone Calls, Tasks, Projects, Messages, Reports, Agents, Stripe → MYOB, Settings. You will only see yours.
 - **The workshop itself runs on Mechanics Desk**, not the portal — see §3 for the parts, letters and counting tools the portal does provide.
-

3. Workshop tooling

The workshop runs on Mechanics Desk. Bookings, job cards, customers, vehicles, quotes and invoicing all happen in MD — not in the portal. Nothing in this document changes that.

The portal's own Diary, Jobs, Customers, Vehicles, Quotes, Invoices, Comms, Orders, Inventory, Live Bins, Cash Count and Suppliers screens have been **switched off**, so nobody enters work into a system nobody reads. If you land on one from an old bookmark you'll get a short "not in use" notice. Clicking **Workshop** in the top bar now opens Pre Pick.

Six things remain, all on one tab strip:

Tab	What it's for
Letters	Thank-you letters and envelopes
Pre Pick	What parts the next 14 days need
Purchase Orders	Ordering and receiving parts
Stocktake (MD)	Counting against Mechanics Desk
Stocktake (Portal)	Barcode counting in the portal
Stock Transfer	Moving stock JAWS ↔ VPS

3.1 Customer letters

A thank-you letter and envelope are queued automatically for every newly finalised MYOB invoice and printed on the Apeos in the comms room. Deposit-only invoices are skipped deliberately.

- Reprint one, compose one by hand, or edit the templates: **Workshop → Letters**.
- Nothing to do day to day — it runs hourly. If letters stop appearing, see §10.

3.2 Pre Pick — what parts we'll need

Workshop → Pre Pick shows the next 14 days of booked work against stock on hand, so you can order ahead instead of discovering a shortage on the day. It is refreshed from MechanicDesk several times each weekday.

3.3 Purchase orders

Workshop → Purchase Orders — draft → sent → received, then push the bill to MYOB.

3.4 Counting stock

- **Stocktake (Portal)** — create a session, scan barcodes to count, review **Variance**, then **Apply**. **△ Counted rows are sacred**. If a count looks wrong, investigate before applying — applying writes the variance away.
- **Stocktake (MD)** counts against Mechanics Desk instead, and is report-only.

“On cars” — why the shelf is short, before you re-count it

Stocktake (MD) has an **On cars** panel above the uploads. It lists the parts already fitted to cars sitting in the workshop on jobs that haven't been invoiced yet. Mechanics Desk still counts those parts as on-hand, so **your shelf count will be short by exactly that much, and that is correct** — nothing is missing.

Read it before you start chasing a variance:

- **By part** — every part number with units on cars, MD's on-hand, and a **Should count** column: what the shelf ought to physically hold. Count against that number, not MD's on-hand. Click a row to see which cars.

- **By car** — each vehicle with parts on it, oldest first, and how many days it has been open. A car that has been sitting for months is usually a job somebody forgot to invoice; that is worth chasing on its own.
- ↻ **Check Mechanics Desk** re-runs it (a couple of minutes). It also runs by itself early each weekday morning, so it is normally current before anyone starts counting.
- ↓ **Export CSV** downloads whatever you are looking at — the view you are on and anything you have typed in the search box. **By part** gives one row per part with the Should count column, ready to sit next to your count sheet in Excel. **By car** gives one row per part on each car, which is the sheet to carry around the shop when you are checking what is actually bolted to what. Both start with the date the check ran.

Cars booked in for later are deliberately NOT counted, even when their parts have already been picked — the car isn't here, so those parts should still be on the shelf for you to find. If the panel says it's over a day old, or warns that some days didn't load, press Check before you trust the numbers.

3.5 Stock transfer

Stock Transfer moves stock between JAWS and VPS, raising the paired invoice and bill and the matching MD purchase order.

4. Distributor orders (B2B)

4.1 What happens without you

When a distributor pays, the portal already: marks the order paid, empties their cart, writes the MYOB invoice to the cent, prints the pick list grouped by consignment, raises and emails supplier POs for drop-ship items, and posts to Slack.

So the order that lands in front of you is already invoiced into MYOB as a **sale order** and picked out on paper.

4.1a What distributors see for pricing

Every price in the distributor portal is GST-inclusive — catalogue, cart, freight options, order history and the order emails. If a distributor rings and quotes a figure at you, it already has GST in it.

Two deliberate exceptions: the **tax invoice** shows the ex-GST subtotal, the GST and the total, because that is what a tax invoice must show; and the **staff-side admin screens** (freight zones, dropship calibration, catalogue export) are ex-GST, because that is how costing is done. Those are labelled.

⚠ **If a distributor says a line is "a cent out", they are probably right, and it is not a bug in the cart.** Prices are stored **ex-GST**, and most of ours were set by taking a round inc-GST price and dividing by 1.1 — which does not divide evenly. The 20 L oil is stored at \$163.64, and 163.64×1.1 is \$180.004, not \$180.00. One shows \$180.00; two show \$360.01, not \$360.00. Only prices whose ex-GST cents end in 0 are immune, and **42 of our 50 priced items are not**.

Nothing is being overcharged at random — the line total is the honest GST on the real ex-GST price, and it is what MYOB will invoice. But the "each" figure is rounded per bottle and the line total is rounded once, so the two disagree by a cent or two on bigger quantities. Say that plainly to the distributor; don't adjust the invoice to match the multiplication. If you want a price to be exactly round including GST, it has to be set so the ex-GST cents end in 0 (e.g. \$163.60 ex = \$179.96 inc) — tell Chris rather than editing around it.

4.1aa Minimum order quantity

Some items only make sense sold in a minimum — a carton, a set of four, a length nobody wants one metre of.

Admin → B2B → Catalogue → open the item → Order limits → Min qty per order.

Leave it blank for no minimum. Once set:

- The catalogue tile reads "**Minimum order 4**" and its button says **Add 4 to Cart** — a distributor lands on a valid quantity rather than discovering the rule at checkout.
- The cart stepper won't go below it. **Remove** still works, and always will — a minimum must never trap a line in someone's cart.
- It's enforced again when the cart is saved and once more at checkout, so a cart built before you set the minimum can't slip through.

⚠ **The minimum can't be higher than the max qty per order** — that combination makes the item impossible to order, and the portal refuses to save it. If a minimum is higher than what's currently in stock the tile says "**Need 4 — only 2 available**" instead of offering an Add button that would fail.

Both limits are in the catalogue CSV export/import as **Min Order QTY** and **Max Order QTY**, so a batch of items can be set in one go.

4.1b Changing quantities

The quantity box in the cart and on the catalogue tile is **typed as well as stepped** — click it, type 24, press Enter. You no longer have to press + twenty-four times, and holding + no longer lags: presses are collected and written once you stop, about half a second later.

While a change is settling, the stepper fades very slightly and the line total dims. The dimmed figure is the **last confirmed** price, not the new one — it snaps to the real total a moment later. That is deliberate: volume-break pricing is worked out on the server, so the portal will not guess at a price it hasn't been given.

4.1bb Reading the Orders list: two columns, not one

The Orders list used to carry a single **Status** pill. It has been split into **Payment** and **Shipping** (25 August 2026), because an order has two separate stories - has the money arrived, and have the goods left - and one green "Paid" pill made a boxed-up order look like it had already gone.

Payment	What it means
Not paid	Checkout was never finished. Not an order - see 4.1c.
Paid	Card payment, money is ours.
Paid - bank, unsettled	Bank Direct Debit accepted, funds still clearing (2-3 business days).
Paid - PayTo, unconfirmed	PayTo agreement accepted, not yet confirmed.
Refunded	Some or all has been refunded - the amount shows underneath.

Shipping	What it means
No consignment	Freight hasn't been booked in the portal yet.
Pending consignment	A consignment exists in MachShip but is unmanifested - no carrier has been told anything, no collection is booked, and the goods are still here.

Shipping	What it means
Booked for collection	Manifested. The carrier has been told what is coming and a collection is booked.
Shipped	Despatched.
Delivered	Carrier reports it delivered.
Consignment missing	The consignment stopped answering in MachShip - see 4.2b.

⚠ **"Book Freight" does not book anything with the carrier.** It creates a *pending consignment* and prints the paperwork. **Ship Now** is what manifests it, and manifesting is what books the collection. The button name is misleading and the column deliberately isn't.

⚠ **Amber in the Payment column means the money is not yet in the bank.** Both `becs` and `payto` mark an order paid the moment the mandate is accepted, and it stays amber until the funds settle. **Shipping an amber order is a credit decision** - Ship Now will warn you and make you approve it. That warning is the point, so read it rather than clicking through.

4.1bc Has the money actually cleared?

Admin > B2B > Orders > open the order > Summary > "Check if payment cleared".

Card and PayTo payments settle at checkout. **Bank Direct Debit (BECS) does not** - checkout only accepts the mandate, and the funds land 2-4 business days later. The order shows **Paid - bank, unsettled** until Stripe tells us the money arrived.

That confirmation normally arrives on its own, from Stripe. If it goes missing - a dropped webhook, or one that fired mid-deploy - the order sits unsettled indefinitely: Ship Now keeps warning about credit risk and the payment is never receipted into MYOB. The button asks Stripe directly.

What you get back:

- **"has cleared - the order is now marked settled"** - money is ours. The order flips to settled and, if the tax invoice already exists, the customer payment is receipted into MYOB automatically.
- **"is 'processing' - not cleared yet"** - the debit is genuinely still in flight. Nothing is changed. Normal for the first few days.
- **"has NOT cleared and will not"** - the debit failed or was cancelled. **Chase the distributor before shipping anything.**

The button only appears on a paid order that hasn't been confirmed settled, because that is the only time there is anything to find out. Pressing it repeatedly is safe.

⚠ **It reports what Stripe says - it never marks something settled on its own.** If Stripe says not cleared, the answer is no, however long it has been.

4.1c Orders that were never paid for

A checkout that was started and abandoned no longer appears on the Orders page.

The order row has to exist before the distributor is sent to Stripe - its id is the reference the payment session is keyed on - so someone who reaches the payment screen and backs out leaves a row behind. Those used to sit on the Orders page reading **Awaiting payment**, indistinguishable from a real order owing money. Weirys did

exactly this on 25 August: B2B-2026-000051 showed \$8,081.26 unpaid while the same cart went through 27 minutes later as B2B-2026-000052.

They are now hidden from the list and left out of its value total. Nothing is deleted - the **Checkout not finished** tile still counts them, and clicking it lists them. The status is also renamed from "Awaiting payment" to **Checkout not finished**, because that is what it means.

Bank-transfer and PayTo orders are NOT affected. Those are genuinely paid orders awaiting settlement; they show as **Paid** and stay on the list where you can see them. Only an unfinished Stripe checkout hides.

⚠ **Don't chase one for payment.** If a distributor tells you they were charged but the order looks unfinished, don't assume - check Stripe. The payment either completed (and there will be a second, paid order) or it didn't.

4.1d When a drop-ship PO email says "email failed"

The PO itself is fine - it exists in MYOB. Only the email to the supplier didn't go, and **Re-send** on the order retries it.

The commonest cause is the supplier's **Email field on their MYOB card holding more than one address**, e.g. `sales@x.com; accounts@x.com`. Our mail provider needs one clean address per recipient and rejects the whole send otherwise. That is what stopped MPI AUTOMOTIVE's PO 00001382 on 25 August, having worked fine three weeks earlier - the address was never wrong, the field just had two in it.

Since 25 August the portal splits that field itself and mails every address in it, so multi-address cards work. If a send still fails, the error now **quotes what the card actually holds**, so you can see what to fix rather than guessing:

- **"isn't a usable address: ..."** - the MYOB card has something that isn't an email. Fix the card, then Re-send.
- **"No email on the MYOB supplier card"** - genuinely blank. Add one, then Re-send.
- Anything else - the provider rejected it for another reason; tell Chris and quote the message.

The PO number a supplier sees is our MYOB invoice number (from 26 August 2026). A drop-ship PO raised against `JAWSB2B0060` is numbered `JAWSB2B0060` in MYOB and on the supplier's email, so when their invoice comes back quoting it, it points straight at the sale it belongs to. Previously MYOB assigned its own sequential number (`00001382`) which matched nothing on either side. Where one order drop-ships from **more than one supplier**, the second and later POs get `-2` , `-3` appended, because MYOB will not allow two purchases with the same number.

`orders@justautoswholesale.com` is **CC'd on every supplier PO email, raised or re-sent**. That copy is how you confirm it went - the portal sends through a provider, so nothing appears in a Sent folder. Until 26 August a **re-sent** PO went to the supplier alone: no copy for us and replies pointed at the wrong mailbox, so a successful re-send looked like nothing had happened. Both paths now use the identical envelope.

⚠ **Re-send does not re-raise the PO**, so it can't create a duplicate in MYOB. "Re-raise drop-ship PO" is the one that does - only use it if the PO itself is wrong.

4.1e Tune jobs: reading the filters

Admin > B2B > Tune Jobs. Two filters, and they now cross-cut properly (26 August 2026). Pick a distributor and the status tabs count **that distributor's** jobs; pick a status and the distributor list counts jobs **in that status**. Until now the tabs always counted every job in the system, so selecting Penrith still read "187 awaiting details" while the table below showed only theirs.

A status tab with nothing in it is hidden. It comes straight back the moment a job lands in that status. That is deliberate rather than deleting the statuses: **Unmatched** and **Submitted** are empty today but both are real -

- **Unmatched** - a receipt arrived whose company name matched no distributor. It has never happened, but if the matcher ever misses, this is where the job waits.
- **Submitted** - the distributor has filled the details in and the job is queued for MechanicDesk. It passes through in seconds, so you will normally never see it. **If jobs start piling up here, the MD sync worker has stopped** - that is exactly when you need the tab, so it must not be deleted for being empty in good times.

4.1f Tune-job reminders: who gets what, and when

Distributors are chased every Friday, about 8:20am Brisbane. One email per distributor listing their own outstanding jobs, plus a portal push. A job is only included once it is past the 3-day visibility delay, so nobody is chased for a tune they cannot see yet, and a distributor is only emailed once a week.

Matt gets a recap immediately afterwards (added 26 August 2026) - one email covering **every** distributor with jobs outstanding: how many, how old the oldest is, what it is worth, and whether they were actually chased. Distributors who received nothing are called out at the bottom in amber.

⚠ **A reminder only goes to a distributor with at least one portal login.** That gate is deliberate - nothing emails a distributor who has never used the portal - but it means a distributor who never signs in never gets chased and never appears to be a problem. That is why the recap lists them separately: they are the ones needing a phone call, not another email.

To run it early: Admin > B2B > Tune Jobs > **Send reminders now.** That fires the distributor reminders and the recap to Matt, exactly as Friday would.

4.1h Distributors with more than one store

Some distributors run several branches under **one entity** - same ABN, bank account, MYOB card and trade pricing - and just need the goods sent to whichever branch ordered them. That is now one account with several **delivery sites**, not two accounts (26 August 2026).

To add a site: Admin > B2B > Distributors > open the distributor > **Delivery sites** > *Add a delivery site*. Give it a name the distributor will recognise ("Rockingham", "Head office"), the address, and a **postcode - freight is priced on it**. Add the branch's own contact name and phone if you have them; that is who the carrier rings, not head office.

What the distributor sees: a **Deliver to** dropdown at the top of the freight section in their cart. It only appears when they have more than one site, so nothing changes for single-site distributors. Changing it **re-quotes freight to that postcode** and clears any rate they had already picked, because the old rate was for the old destination.

Every distributor's existing address was brought across as their **default** site, so nothing changed for anyone until a second one is added.

⚠ **Sites are staff-managed, not self-serve.** Where a distributor's goods may be sent is a credit and fraud decision - their portal only ever picks from the list you set. If a distributor asks for a new delivery address, add it here.

To change a site, press **Edit** on it, adjust any field and **Save changes**. Editing the address a distributor has already ordered to is safe: past orders keep the address they were actually shipped to, so nothing reprints differently. Changing the **postcode** of a site changes what freight quotes at, including for carts already open on it.

Removing a site stops it being selectable but keeps history: past orders keep the address they were actually shipped to, printed on their pick list, labels and tax invoice. You cannot remove the default while other sites exist - make another site the default first.

4.1i Stock Wall and Suppliers have been switched off

Both came off the B2B menu on **26 August 2026**.

- **Stock Wall** — the Slack parts bot answers stock questions now, and **Stock Order** covers reordering.
- **Suppliers** — the read-only supplier logins were never taken up; no supplier account was ever created. Drop-ship POs reach suppliers by email instead. The supplier sign-in page is closed too, since nobody was administering it.

If you land on one from an old bookmark you get a short "not in use" notice explaining why, on the same URL.

Nothing was deleted — the screens and their data are still there, off the menu. Ask Chris if you need either back.

4.2 Pick, pack and despatch

⚠ **This changed on 20 August 2026.** Booking freight and despatching are now two separate steps. Booking no longer sends anything to the carrier and no longer raises the tax invoice.

1. **Admin** → **B2B** → **Orders**, open the order.
2. Check the **packing plan (Boxes and consignments)** on the order). The portal cartonises automatically, picking the smallest standard box each item fits - which is often not the box the warehouse actually reaches for, and the box's dimensions are what MachShip prices and the carrier bills.
 - **Change a box:** use the **ships in** dropdown on any consignment to move it into a different standard box, or to "Own packaging" for an item that travels in its own carton.
 - **Merge consignments:** tick two or more, choose the shared box, **Combine** - e.g. oil and a sump together to save a consignment.
 - **Reset** returns the whole order to automatic packing.
 - **Pallets can't be re-boxed or merged** - their tickbox and dropdown are disabled. A pallet is not a box: change **pack mode**, or change the pallet itself in Settings → Freight packaging.

Every change saves against the order, and freight booking and the pick list both use it verbatim, so what MachShip charges is what the warehouse packs. Reprint the pick list after changing anything.

Where it is: inside the **Shipping** card, as a collapsed link - click **Boxes and consignments** to open it. Until 25 August 2026 that link was hidden entirely once freight was booked, and never appeared at all on orders using static or satchel freight, which is why it may look new.

On a palletised order the plan has two levels (new 27 August 2026). Each pallet lists **the boxes stacked on it**, and each box lists what goes in it. Pack it in that order: fill the boxes first, then load the boxes onto the deck. The printed pick list shows the same two levels - **BOX 1, BOX 2** and so on underneath each pallet - so tick items off box by box. Before this the sheet listed a pallet and then every product in the order in one flat list, which told you nothing about what went in which box.

A mix of pallets and cartons on one order is normal. Since 27 August 2026 the quote compares packing it all on pallets against palletising only the bulky items and sending the boxes as parcels, and takes whichever the carrier prices cheaper. So an order can legitimately show, say, one pallet and sixteen cartons. **Do not "fix" it** - that is the plan the distributor was charged for and the one the carrier is expecting.

Pallet loads may look unevenly filled. One pallet stacked high and another barely used is usually the cheapest arrangement, because a part-used layer costs the same height as a full one. The system does try to even them out and only leaves them lopsided when levelling would cost more.

Long items still go ON the pallet. A 1650 mm exhaust lies flat on an 1800 × 1200 deck, and that is where the plan puts it - Hunter Mechanical's three exhausts all ride on pallet 1. The system tries every orientation before giving up on a pallet.

Only something that fits no deck at all ships beside the pallets - a 2.4 m bar, say, which overhangs every pallet you have. It then appears as its own consignment next to them rather than being pretended onto one, which is correct: the carrier is expecting it as a separate item. If you see this on an order where you would expect the item to fit, check that the pallet it needs is still switched **on** in Settings → Freight packaging: switch off the 1800 × 1200 and a 1650 mm exhaust has nowhere to go but its own consignment.

You can still change the boxes after booking, until the order is manifested. A booked consignment exists in MachShip, but nothing has reached the carrier and no label is in anyone's hands - so re-boxing then is normal packing work. Change the boxes, press **Re-book freight**, then reprint the pick list and labels. Once the order has been manifested by **Ship Now** the boxes are fixed and the panel goes read-only: the carrier has been told exactly what is coming.

3. **Book Freight.** This creates the MachShip consignment and prints the pick slip, consignment note and labels. The consignment sits **Unmanifested** — the carrier does not know about it yet.
4. Pick and pack the order against the paperwork.
5. **Ship Now.** This is the step that actually despatches: it manifests the consignment with the carrier, converts the MYOB order into a tax invoice, receipts the payment against it, prints the A4 tax invoice and emails the distributor their tracking.

⚠ **Ship the run in one action, not one order at a time.** MachShip books a carrier *pickup* when you manifest, so shipping ten orders individually raises ten pickup requests. Select the whole run and ship it once.

If nothing is reaching the carrier, the usual answer is that Book Freight was pressed but Ship Now was not.

An order stays at its current status when you book it. Until 25 August 2026, Book Freight marked the order **shipped** straight away - a leftover from before the two steps were split - so orders sitting on the bench read as shipped, both on the orders list and in the distributor's own portal. Booking now only records the carrier; **Ship Now** is what marks it shipped, which is what it always should have been.

4.1f2 Supplier replies: acknowledged vs dispatched

A supplier's reply to a drop-ship PO is one of three things, and the portal now tells them apart (26 August 2026):

Reply	What it means	What the portal does
Acknowledged	"All in stock, we'll get it out today." Accepted, but nothing has left.	Records the expected dispatch date, emails it to the distributor, posts to Slack. Nothing is billed or invoiced. Keeps watching for the dispatch email.
Dispatched	It has actually shipped - their invoice, consignment number or freight details come with it.	Bills the PO in MYOB, converts our sale order to a tax invoice, receipts the payment, notifies the distributor.
Neither	Backorder, decline, a question, noise.	Logged and ignored.

⚠ **This is why "will ship today" no longer triggers invoicing.** Until 26 August both of the first two counted as confirmation, so a stock acknowledgement billed the PO and raised the distributor's tax invoice days before the goods moved. A future or same-day promise to ship is **acknowledged**, not dispatched - "will ship today" is not "has shipped".

If in doubt the classifier chooses the safer option: acknowledged over dispatched, and neither over both.

You can still force it. If you know an order has shipped and no dispatch email is coming, press **"Supplier confirmed - bill PO + invoice"** on the order.

4.1g When a drop-ship "receive" fails

When a supplier confirms a drop-ship, the portal does three things in order: **bill the PO** in MYOB (which receives the stock into that supplier's DS location), **convert the sale order to a tax invoice** (which consumes that stock), then **receipt the payment**.

The order matters. If the bill fails, the invoice conversion cannot succeed - the stock it needs is exactly what the bill receives. Until 26 August it was attempted anyway, and MYOB rejected it with

`Inventory_InsufficientStockMultipleLocation` : an alarming inventory error that says nothing about the real cause. B2B-2026-000052 hit exactly that.

Now the conversion is **skipped** when a PO is unbilled, and the order timeline says so plainly. What you will see on the order page:

- `dropship_po_bill_failed` - the real problem, naming the PO, the supplier and MYOB's reason. Bill failures used to leave no trace at all.
- `convert_invoice skipped` - with which POs are outstanding.

What to do: fix the reason the bill failed (usually the supplier or item is not linked in MYOB, or the DS location is missing), then press **"Supplier confirmed - bill PO + invoice"** on the order to re-run the whole chain. It is safe to press again: the bill, the invoice and the payment each have their own idempotency check, and a PO already billed by hand in MYOB is adopted rather than billed twice.

⚠ **The Slack alert now carries the reason.** It used to say only "hit a snag - check the order page".

4.2a Matching an order to its MYOB invoice

Admin → B2B → Orders → open the order. The **Summary** card now leads with the **MYOB invoice** number — `JAWSB2B0055` — above the distributor and the customer PO, with the date it was invoiced beneath it. That is the number MYOB, accounts and the distributor all quote, so when someone rings about "Cutlers JAWSB2B0055" you can match it without hunting.

Until the invoice is written it reads **"Not written to MYOB yet"** in amber. The MYOB card further down the right-hand rail still carries the diagnostics — company file, write attempts, and the error if a write failed.

The **Timeline** card shows the **three most recent events** with "N earlier events hidden" above them; **Show all N events** opens the lot. A busy order — drop-ship POs, freight polls, a refund — used to run to a wall of entries, and what you almost always want is what happened last.

4.2b "Consignment Missing" on a shipped order

If the freight panel says **Consignment Missing**, the consignment MachShip gave us has stopped answering — nearly always because someone deleted and re-created it in MachShip, which issues a new internal id while the shipment carries on under the same carrier tracking number.

The portal now recovers from this by itself. When the id stops resolving it looks the consignment up again by the **carrier tracking number** (the number on the label, e.g. EYA000002055), then by the order reference, and if it finds a single unambiguous match it adopts the new id and resumes tracking. Parked orders are retried every **6 hours**, so an order that stuck earlier can come back on its own — it is no longer a dead end.

What to do: press **Refresh from MachShip** on the order to try immediately rather than waiting for the retry. If it still can't find it, the consignment genuinely isn't there under that tracking number and the message will say so — mark the order delivered manually when it lands.

⚠ **"Awaiting despatch — not manifested" on an order that has clearly shipped.** If a consignment is manifested outside the portal — someone despatching it from MachShip directly — the portal never gets a manifest id, and until 25 August it went on offering **Ship now** on freight the carrier had already delivered. Pressing it would have re-manifested the shipment and raised the tax invoice a **second time**. The portal now reads the carrier's own status instead: anything past "unmanifested" counts as gone, and both the button and the action behind it are withdrawn. If you ever see Ship now on an order that is plainly on a truck, don't press it — tell Chris.

⚠ It matches on the tracking number, not the MS... consignment number. A re-created consignment gets a new MS... number, so that one is no help — and if two consignments share a tracking number the portal deliberately refuses to guess rather than risk attaching your order to someone else's shipment.

4.3 Freight problems

Symptom	What to do
Consignment shows <code>consignment_missing</code>	It vanished at MachShip's end. Rebook from the order page.
Booking blocked on an unsettled BECS payment	Deliberate — the money hasn't cleared. If you accept the risk, the Book button offers "Book anyway"; the decision is stamped on the order timeline.
Rates look wrong	Admin → B2B → Settings → freight zones / carriers / packaging. Drop-ship rates have their own calibration panel.

4.3a Pallet options (Admin → B2B → Settings → Freight packaging)

You can configure **as many pallets as you actually ship on**, not just one. Each has a name, a deck size, the tallest stack you will build on it, and a max weight. Add a *Half pallet* alongside the standard one and the system will use whichever suits the order.

How it picks (corrected 27 August 2026). The order is **boxed first**, then those boxes are stacked onto pallets. Whichever pallet ships the order in the **fewest units** wins; if two do it in the same number, the **smaller deck** wins, because that is normally the cheaper freight.

A pallet is now filled by **weight and by space**, and it is only offered if the boxes physically fit on its deck. That matters: until this change the system only counted weight, so a bulky-but-light order was declared as one pallet it could never have fitted on, and a deck too short for the goods could be chosen because it was the smaller of two on the same weight limit. A real Hunter Mechanical cart - 289 kg, 2.3 m³, with 1650 mm exhausts - was being quoted as **one 1100×1100 pallet**; it is now two 1800×1200 pallets, which is what it actually takes.

The tallest stack you enter is a ceiling, not the quote. Freight is quoted on the height the goods **actually** stack to, plus the pallet base - so a half-empty pallet is priced as a half-empty pallet. Until 27 August 2026 every pallet was declared at its full height, which overcharged the distributor on any order that did not fill the deck: Hunter Mechanical's second pallet was being declared at 1500 mm for a 450 mm stack, and now reads 600 mm.

⚠ **Get the max weight right.** The weight you enter is taken literally. Enter 400 kg and the system will happily load 400 kg onto one pallet - check that both the carrier and your forklift will take it.

Palletise over (kg) sits underneath the list and is deliberately separate. It decides whether an order goes on pallets *at all* instead of boxes, which is a decision about the whole order rather than about any one pallet — so it is set once. An order containing an item marked as pallet-packaging always palletises, whatever it weighs.

⚠ Deleting or switching off every pallet means orders ship in cartons no matter how heavy they are. The list warns you when it is empty.

4.3d Getting a distributor onto the app

Distributors can install the wholesale portal as a proper app - own icon, own window, no browser tabs - on a phone, tablet or computer. There is nothing in the App Store or Google Play; the site installs itself.

Send them the PDF: Admin → Library → *Installing the Just Autos Wholesale app*. It is written for them, so it can be forwarded as-is.

The one thing that goes wrong: they must be on a **/b2b** web address when they install - send them to `justautos.app/b2b/login`. Installing from `justautos.app` on its own gives them the **staff** app, which they cannot sign in to. If someone ends up locked out of an app they just installed, that is almost always why: delete the icon, install again from the **/b2b** address.

On an iPhone it must be Safari. Chrome on an iPhone cannot install it. Notifications on iPhone also only work once the app is on the home screen - not from Safari - and need iOS 16.4 or later.

4.3c Freight markup bands (Admin → B2B → Settings → Freight Pricing)

New 27 August 2026. The markup added to the carrier's price is no longer one number for every job. It is now a set of bands, and they came from Chris:

What the carrier charges us (ex GST)	Markup
up to \$500	20%
over \$500 to \$1,000	10%
over \$1,000	5%

The band is picked by OUR cost, not the price the distributor pays. MachShip quotes us \$480, that is the first band, 20% is added, the distributor sees \$576.

The upper limit is inclusive. \$500.00 exactly is in the 20% band; \$500.01 is in the 10% band.

⚠ **The bands are steps, not a sliding scale — and that has a sharp edge.** A \$500.00 carrier price earns us \$100. A \$500.01 one earns \$50. So a slightly dearer consignment can cost the distributor *less* overall. This is deliberate, but it means the boundaries are worth knowing when you are near one: if a quote comes back just over \$500 or just over \$1,000, sending it a different way (see the packing options in 4.3b) may cross a boundary and change the total more than you would expect.

Editing them. Each row is a band; *Up to \$* is its top and blanking it makes it the open-ended top band (there can only be one). Add or delete bands freely. **Fallback markup** underneath is only used if there are no bands at all, or if a price somehow falls outside every band — it is a safety net, not the normal path.

This applies to **live carrier quotes only**. Postcode-zone rates, flat-rate satchels and drop-ship freight all carry a price you set directly, so there is no markup to band.

4.3b Freight quote (Admin → B2B → Freight quote)

New 27 August 2026. A calculator: add products, type a suburb and postcode, press **Quote freight**, get live MachShip rates. No order is created and nothing is saved - use it freely for "what would this cost to send to X". It replaces having to open the test-order builder just to see a price.

Pick a distributor to prefill their address (you can still edit it, so quoting a one-off delivery is fine). **Pack as** is normally left on *Auto*.

Each price can be expanded to show what it was priced on - press *Show the N consignments*. You get every pallet and carton, and for a pallet, the boxes on its deck and what goes in each. If a number looks wrong, that is where the answer is.

Auto now prices more than one packing and takes the cheapest. The same order can go out as two pallets, as one pallet with the neat boxes travelling as parcels, or as all parcels - and which is cheapest is genuinely not predictable: fewer, bigger units means less declared cube but more handling per item. Each carrier is shown at its own cheapest packing, and the packing named under the rate is the one that would be booked and printed. Hunter Mechanical's cart, for scale: 2 pallets = 4.47 m³, one pallet plus 16 parcels = 3.68 m³, 36 parcels = 2.47 m³.

4.4 Drop-ship orders

Items we don't hold are ordered from the supplier automatically at payment. When the supplier replies to that PO email, the portal reads the reply and does the rest: bills the PO, flips the sale order to an invoice, receipts payment, passes the ETA to the distributor and posts to `#jaws-orders`.

You only step in if the supplier replies with something unexpected, or replies with a link instead of an attachment — [△](#) link-only emails are invisible to the automation.

4.5 Refund a distributor

1. Admin → B2B → Orders → open the order → **Refund**.
2. **Items mode** — tick the lines and quantities being returned (just the airbox, say). The amount is worked out server-side from the exact prices charged, and the portal will not let the same units be refunded twice.
3. **Amount mode** — for freight or the card surcharge.
4. Confirm. A credit note is mirrored into MYOB automatically.

4.6 Onboard a distributor

1. Admin → B2B → Distributors → **Add**. Start typing the business name — it matches live MYOB customers, so the card is linked from the start.
2. Open the new distributor → **Invite users**. They receive a magic-link welcome email.
3. The distributor's owner adds the rest of their own team.

One person can belong to more than one distributor and switch between them in the portal.

4.7 Catalogue and pricing

Admin → B2B → Catalogue. Prices and visibility are editable inline; the drawer has the full record. Bundles ("includes") ship inside the parent's box, which affects freight, so check the packing plan after changing one.

4.8 Training

Admin → B2B → Training. Assign a course to a whole distributor or to named people — courses are invisible until assigned. You can generate a course from an uploaded PDF. Preview plays the real course without recording an attempt.

4.9 Test the whole pipeline safely

Admin → B2B → **Test Order** runs a real order end to end against a distributor you choose. Use it after any change to pricing, freight or the pipeline.

5. Accounts Payable

5.1 The daily run

1. **AP Invoices.** New supplier bills arrive by email and are read automatically — supplier, invoice number, date, totals, line items, GST.
2. Work the queue. Each invoice is either posted to MYOB automatically or **flagged** for you.
3. Open a flagged one to see why. Common reasons: the totals don't add up, the supplier isn't recognised, or the period is locked.
4. Fix and post, or reject.

⚠ **Locked-period invoices are never silently re-dated.** They flag, and you decide.

5.2 The Slack flag card — what the buttons do

Every invoice the automation won't post itself lands as an orange card in the AP Slack channel, with the reason and a link to the PDF. The buttons:

Button	What it does
View invoice	Opens the PDF (the link lasts 7 days).
 Approve & post to MYOB	You are vouching for whatever was flagged. Posts the bill straight away and files the email to Read /Printed.
 Create supplier	Only on "supplier not matched" cards. Reads the vendor's details off the invoice and threads them for you to check <i>before</i> any MYOB card is created.
 Entered manually?	Asks MYOB whether someone has already keyed this invoice in by hand. Only looks — it never posts anything.

Press "Entered manually?" before you touch an older card. Most flagged invoices get typed into MYOB by whoever is doing the accounts that day, and the Slack card then sits there looking outstanding forever. If the bill is there, the card turns green — " **Posted manually**" — the MYOB bill is linked to it, the email is filed away, and the automation stops chasing it.

If nothing exact turns up but MYOB holds a bill for the **same supplier at the same amount** (a hand entry often keys the invoice number differently), those come back in the thread with a  **Link bill #...** button. Check it really is the same invoice before linking. If nothing matches at all it says so and leaves the card alone — the invoice still needs entering.

Never press Approve & post on a card you haven't checked for a manual entry. That is how the same bill ends up in MYOB twice.

5.3 Duplicates

Suspected double-ups are marked with 🔄 and posted to Slack rather than entered twice. Check the original before dismissing.

5.4 Supplier statements

AP → Statement. Upload or let the watcher read the statement PDF; it reconciles against MYOB and hunts down what's missing. Capricorn statements are **report-only** — do not post from them.

5.5 Suppliers that behave differently

Some suppliers are on allowlists — consolidated billing, or pay-on-proforma. If a supplier's invoices keep flagging for a reason that is actually normal for them, that is an allowlist change, not a per-invoice fix. Ask Chris.

6. Quote channels (sales reps)

Each rep has a Monday board. The portal feeds it and reports on it; the day-to-day happens in Monday.

6.1 The follow-up cadence

A quote goes out and the clock starts. You get three touches — at **3 days**, **7 days** and **14 days**.

1. The item appears in **Quote - Follow Up** when it's due.
2. Make the call.
3. Set the status:
 - **Follow Up Done** — you spoke to them. The item hides itself and comes back at the next interval.
 - **RLMNA** (rang, left message, no answer) — counts as an attempt.
 - **Quote Won / Quote Lost** — done either way.
4. After the third follow-up, the owner is notified: it now has to be Won or Lost. Don't leave it drifting.

6.2 What RLMNA does

Where the item is	After how many RLMNA clicks	What happens
Quote - Lead RLMNA (never quoted)	5	Status → Quote Not Issued, moved to Quote - Not issued
Quote - Follow up RLMNA (quoted)	3	Status → Quote Lost, moved to Quote - Lost

A never-quoted lead is **not** a lost quote — that's why the two paths end differently.

6.3 If the board misbehaves

Two faults were found and fixed on 20 August 2026. If you see either shape again, say so immediately rather than working around it:

- **A quote goes to Lost on the first RLMNA click.** Means the attempt counter is being incremented more than once per click.
- **"Follow Up Done" appears to do nothing** — status set, item doesn't move. Means that item's **FU Stage** field is blank; the automations only match stages 1, 2 and 3.

7. Phone calls and coaching

Phone Calls lists every call with audio and transcript, plus coaching analysis scored against a rubric for that call type. Tabs cover sentiment, coaching, word usage and conversion. A team coaching summary posts to Slack on Monday mornings.

Supervisors with permission can **Listen**, **Whisper** (only the rep hears you) or **Barge** (join the call) live.

Click-to-dial is available where enabled.

8. Reports

8.1 Weekly Sales Recap

Reports → **Sales Report**. Emails Ryan automatically at 07:00 Monday.

⚠ "Sales" here means **orders taken**, not turnover. It counts orders from the Monday boards and Mechanics Desk. Don't reconcile it against the P&L and expect a match.

8.2 Management Dashboard

Reports → **Management Dashboard**. The JAWS weekly Excel, live from MYOB. KPI tiles are clickable for history, and charts can be expanded. The cache is warmed at 05:30, so early-morning figures are quick.

8.3 Sales Dashboard

Reports → **Sales Dashboard**. Three views, switched at the top of the page.

Management (opens here) — sales orders against target, three ways: **per month** (last 18 months), **per salesperson** (this month), and **per day** (last 30 days). Each chart carries its target as a dashed line, and each bar is labelled with its total, so you never have to judge it by height alone. Underneath sit the **Cancelled orders** and **Postponed orders** totals.

Things worth knowing here:

- **The per-salesperson chart is this month only.** The target is a monthly one per person, so comparing a longer period against it would be meaningless.
- **Cancelled and postponed are whole-of-board totals**, not filtered to your date range, matching the Monday dashboard. They are **not** part of any sales figure — cancelled and postponed work isn't money in.
- **Staff parts owing is not built yet** — it shows a dash. There's no board of that name, so we need to know which board and filter it comes from.
- **Targets can be changed without a code change.** Ask Chris; they are settings, currently \$1,000,000 a month, \$300,000 per salesperson a month, and \$50,000 a day.

Figures — the sales money: **daily, monthly, per salesperson, and totals**.

Pick the period with the **From / To** date boxes, or use a preset (30d, 3m, 6m, YTD, 12m, 24m). Pick a **Salesperson** to narrow everything to one person — or just click their row in the By-salesperson table, and click again to clear it.

Tiles show the total for the range, this month to date, this year to date, the average trading day, and the best single day and month. Underneath: a bar per day for the last 30/60/90 days, a monthly chart split into workshop orders and distributor bookings, a **By salesperson** table with each person's share, and workshop orders broken down by sale type (Normal Booking, Upsell, Additional Maintenance).

Two things to read correctly:

- **Every calendar day is plotted**, so weekends and quiet days appear as gaps. That is deliberate — closing them up would make the week look busier than it was.
- **The average is per trading day**, counting only days that actually had a sale. Dividing by every calendar day would roughly halve it and flatter nothing.
- **Where an order names two people it counts to the first one**. That keeps each person's numbers adding up to the total. Orders with nobody set show as **Unassigned** — they are never dropped, so if that row is large it means the people column isn't being filled in.
- **The By-salesperson table always shows everyone**, even when you have filtered to one person, so you can compare without clearing the filter.

Pipeline — the quote pipeline across the five rep quote channels: what is open, at what stage, with whom, and what converted.

⚠ **Neither view is turnover**. Both count orders and bookings **taken**. Invoiced turnover is on Reports → Forecast, and the two will never agree — that is expected, not a fault. Cancelled and deleted orders are left out, as are distributor bookings still sitting in pending or postponed.

What is on the Pipeline view:

- **Open pipeline by stage** — Lead, Lead RLMNA, Follow Up, Follow up RLMNA, Pending, On Hold. Always current, whatever the window is set to.
- **Won vs lost by month**, over the window you pick (3, 6, 12 or 24 months).
- **By rep**, with win rate.
- **How long open quotes have been sitting** — the 90+ day bucket is the one worth acting on.

Two things to know when reading it:

- **Quotes count against the channel they sit on**, not the Owner column. Owner is only filled in on currently-active quotes, so it cannot carry history.
- **If a board has a group that isn't a standard pipeline stage** (Kaleb's "Farm Fest" group, for example), those quotes are still counted, and called out in a box at the bottom so the totals always add up to what the boards show.

"Quote - Not issued" is left out of every figure.

8.4 Forecast

Reports → **Forecast**. Turnover month by month, this year against last, for the workshop (VPS) and wholesale (JAWS) sides. Switch between Combined, Workshop and Wholesale with the buttons top-right. Managers and admins only.

It reads the Monday **Forecasting** board live, so whatever the board says is what you see — if a month looks wrong, fix it on the board and reload.

Two things to read correctly:

- **The headline compares completed months only.** The current month is still running and is shown separately, so the year-on-year figure is like-for-like rather than flattered or penalised by a part-month.
- **Months that haven't started yet show orders already booked, not turnover.** They appear as outlined bars and are left out of the headline. A small bar for a future month is normal — it is the bookings taken so far, not a forecast of a bad month.

The change percentages are worked out from the turnover figures themselves, not the "% Increase/Decrease" column on the board, which is only filled in on some rows.

8.5 Workshop Map & Conversion

Reports → Workshop Map. Fed by the nightly Mechanics Desk pull. Five tabs:

Tab	What it answers
Jobs Map	Where our booked work comes from
Quotes Map	Where we're quoting
Conversion	Quotes vs booked jobs, by vehicle and month
By State	State-level revenue and win rates
Vehicle Trend	How each vehicle series is trending over time

Comparing financial years. The FY buttons top-right pick the year you're looking at; the **vs** buttons beside them add up to three more years to compare against. Comparison years only appear on Conversion, By State and Vehicle Trend — two years of dots on a map can't be read, so the maps stay on one year. On Vehicle Trend a comparison year draws as a dashed white line: the total of whichever vehicles you've selected, one line per year.

Comparing vehicle types. The **Compare** row on Vehicle Trend starts on *All types*. Pick any combination of vehicles to narrow it to those, and **vs others** then adds everything you didn't pick as a single grey dotted line — so "70 and 300 against everything else" is one click.

Counting distributor tunes as jobs (Conversion). A distributor tune reaches us as an invoice with the car's VIN in the PO field, so each unique VIN in a month is one more job. **Include distributor jobs** on the Conversion tab folds those into booked jobs, and the conversion % moves with them. It is **off by default**, and the reason matters: those jobs never had a workshop quote, so with it on the percentage reads higher than the workshop's own performance. Use it to see total work done; leave it off to judge the workshop's quoting. The by-vehicle table gains an *of which dist.* column so you can always see what the toggle did.

The toggle is greyed out when a state is selected — a distributor invoice carries no postcode, so those jobs can't honestly be put in one state. Clear the state filter to use it.

Reading Conversion as a chart. The **Table / Chart** switch turns both conversion tables into bars — one bar per vehicle for the year, and grouped bars per month. Same numbers, and with distributor jobs on, their share of each bar is hatched.

Using Vehicle Trend: pick the financial year, and you get one line per vehicle series across the twelve months. Click a month and it redraws day by day for that month. Switch the measure between Jobs, Quotes, Job \$ and Quoted \$. Clicking a vehicle highlights its line rather than hiding the others, so you keep the comparison.

⚠ Vehicle Trend counts **every** invoice and quote, while the map tabs show one dot per customer per month. Its totals are legitimately higher — they are not disagreeing with each other, they are counting different things.

Exporting the list behind one dot (CSV). On the Jobs Map and Quotes Map, click a location bubble and the popup now has a **↓ CSV** button in its header. It downloads every customer behind that dot as a spreadsheet — date, month, customer, vehicle series, job type (jobs) or won/not-won (quotes), the **MechanicDesk invoice or quote number**, amount inc GST, suburb, postcode and state. The popup itself only lists the 40 largest; the CSV has the lot, and says so when there are more.

The export honours whatever the screen is showing — month strip, vehicle chips and state pill — so filter first, then click the dot. The file names itself after the tab, FY and location (`workshop-quotes-FY2026-buderim-4556.csv`).

⚠ One row per customer per month, not one row per quote. These are the map's dots, so a customer who was quoted three times in a month appears once, at the largest quote, and a customer with three invoices in a month appears once at their combined spend with the largest invoice's number. It is a call list, not an accounting extract — for every individual record use the Vehicle Trend tab or MechanicDesk itself.

Export PDF (top right, next to the FY buttons) downloads the whole financial year **month by month** — jobs, revenue, quotes, quoted value, quotes won and conversion for each month, then quotes/jobs/quote-value broken down by vehicle series per month, conversion by vehicle, a state split and the top locations by revenue. It serves the same cached pull the screen shows, so it comes back in about a second and never triggers a MechanicDesk sync.

The month strip does not change the PDF — the export is always the full year, because month-by-month is the point of it. The **vehicle** and **state** filters *do* carry through, and the file is named accordingly (`workshop-map-FY2026-70-qld.pdf`). Filter to one vehicle or state and the booking-deposit figures drop out, because deposits carry neither a vehicle nor a postcode.

⚠ Revenue columns cover mapped records only. A job that never geocoded has no location and no amount in the payload, so it is missing from every revenue figure — but it *is* in the job and quote counts. The PDF states the coverage on its last page (e.g. 1,300 of 1,333 job records). Don't reconcile these revenue totals against MYOB.

8.6 Distributor Map

Quotes near each distributor against bookings they actually confirmed — the "are they converting the leads we send them" view.

Just Autos is on the map too (added 25 August 2026) — our own workshop at Burnside, as a pin and radius like any distributor, so you can see the demand sitting around us. Its pin is white and slightly larger so it doesn't read as a distributor.

⚠ It carries quotes only — there is no "booked" figure for it, and that is deliberate, not a gap. The Monday board is distributor bookings and Just Autos isn't on it, and our own jobs live in Mechanics Desk on a different footing (a distributor's bookings count wherever the customer is; ours would only count near the workshop). Comparing the two would be comparing different things, so the booked and capture columns show — rather than 0. For the same reason Just Autos is left out of the **All distributors** totals and out of the weekly sales recap — pick its pill to see it on its own.

At 50, 100 and 150 km our area can't overlap anyone's, because the nearest distributor is about 390 km away. At **250 km** it starts to overlap the nearest distributor's area, and a quote closer to us counts to us instead of them — so a distributor's number can look lower at 250 km than it did before.

Export PDF (top right of the controls row) downloads every month of the financial year for every distributor: a combined month-by-month table, an FY table per distributor ranked by quotes in their area, quotes / bookings / booking-value matrices with a column per month, and then a small month-by-month table for each distributor on its own — that last section is the one to take into a distributor conversation.

The **radius** you have selected carries into the PDF and into its filename (`distributor-map-FY2026-100km.pdf`), because the radius decides which quotes count as being in whose area. Unlike the Workshop Map export this one recomputes against Monday live, so give it a few seconds.

⚠ **Capture rate is geography, not a tracked hand-off.** "Quotes" are our own workshop quotes that happen to fall within the radius of a distributor; "Bookings" are confirmed rows on the Monday Distributor - Booking board. A low capture rate means quotes near them that they didn't book — it does **not** mean a specific quote was sent to them and lost. A distributor whose Monday label doesn't match a distributor record by name shows zero bookings; "Hunter Mechanical" deliberately stays unmatched because it matches both branches.

8.7 Distributors report — grouping

Distributors (top bar). Under the tab strip there are two controls, and they now apply to **every tab**, not just the Summary:

- **Group by** — `type` (Distributors / Sundry) or `region` (National / International).
- **Showing** — `All`, or one section of whichever dimension you picked.

⚠ **This changed on 21 August 2026, and some numbers will look different from what you remember.**

Each tab used to have its own idea of what was included: Distributor Sales and Detailed Sales quietly counted Sundry customers, Parts : Tunes left them out, and the tab labelled "National Total" actually showed everything — International and Sundry as well. Now every tab shows exactly what the Group by / Showing controls say, so the tabs agree with each other and with the Summary.

Reading it:

- On **All**, every tab includes everything and the Summary breaks it into its sections — that is the honest overall picture.
- Pick a section and the whole report narrows to it, headings included. The old "National ..." headings now name what you are actually looking at.
- **Sundry is always its own section**, under either grouping. A Sundry customer is never counted inside National or International, so the sections always add up.
- Switching Group by resets Showing to All, because a "Distributors" filter means nothing once you are grouping by region.
- **Parts : Tunes still leaves Sundry out on All**, as agreed in July — but if you explicitly pick Sundry it will show it, rather than looking empty.

A dashed line separates the groups on the bar charts, so you can see where Distributors end and Sundry begins at a glance.

Charts show every customer; the totals are printed underneath. Each chart has a bar or slice per customer, and beneath it a line of figures: each group's total, then **All combined** on the right. That way the customer bars stay readable — a bar for the total would tower over everything else and flatten the rest. The Summary table ends the same way, with an "All combined — TOTAL" row under the group subtotals.

A bar can point the wrong way, and that can be correct. If a category shows as negative it means credits outweighed sales for it in the period — CP Performance's Parts is the current example. The chart is telling you the truth; it isn't a fault.

If a customer is landing in the wrong section, fix their membership at **Admin** → **Groups**; the report follows it immediately.

8.8 Build a PDF report

Reports → **Builder**. Choose from six report types — Distributor Performance, Stock Health, Call Analytics, CRM Pipeline, Campaign Performance, B2B Sales — then the period, which entities (JAWS, VPS or both) and which sections. Add AI commentary if you want the numbers narrated. Generate, then download the PDF.

8.9 Stock EOM — the month-end stock report (JAWS)

What arrives without you doing anything. At **7:30am on the 2nd of each month** the portal emails the month-just-ended stock report for JAWS to Chris and Morgan. **The email carries the last six months of sales**, both per SKU against stock on hand (the *Stock position* table — over or under stocked, at a glance) and as a company-file total per month, so the trend is in the email itself and not only behind a link. The full version lives at **Reports** → **Stock EOM**, where you can also pick an earlier month or press **Rebuild from MYOB** if something looks stale.

Choosing how far back to look. Under the buttons is a **Sales history** row: presets for 3, 6, 12 and 24 months, or two month boxes for an exact range. It sets the period every average on the report is worked out over — average sales per month, months of cover, and whether sales are growing or falling. It defaults to the 12 months ending with the month you're reading, and 36 months is as far back as it will go.

Change it, then press **Apply window** — the report rebuilds on the new period (it has to; the old figures were worked out over a different one). The *Sales by month* table shows the period month by month, so a run of rising or falling months is visible at a glance, and the **Growth over the window** tile compares the back half of the period against the front half.

Two different "cover" numbers, on purpose. *Cover (days)* is based on the last 90 days only — it reacts fast. *Months cover* is on-hand at the window average — it's steadier. When they disagree the SKU is seasonal or has just changed pace, and that gap is worth looking at rather than ignoring.

On-hand shows in most tables now, and it is the quantity **as at the moment the report was generated** (shown at the top). MYOB can only ever tell us today's quantity, so on an older month the stock figures are today's, while the sales figures are that month's.

To keep a copy or send it on, press *Export PDF*. It downloads the whole report — every figure and list on the screen — as a PDF named for the month (*jaws-stock-2026-07.pdf*), ready to file or email to the accountant. It exports what is on screen, so if you want the very latest numbers press **Rebuild from MYOB** first.

This is not the same as **Stock & Inventory** (*/stock*), which shows *today* on rolling 30/90-day windows. The month-end report is a frozen snapshot, and it's the only place you can see stock movement **month against month** — MYOB itself only ever tells you today's quantity, so the comparison exists purely because the portal saves each month.

The numbers at the top: stock on hand · sales for the month (ex GST) · gross margin · stock turn and days of inventory · dead stock (nothing sold in 90 days) · **slow movers — capital at risk** · overstock (more than a year of cover) · reorder suggested · never sold (excluded). Each shows the movement against last month once there are two months of history.

Stock that has never sold is left out of the "not moving" figures. On the JAWS item list a part that has never been invoiced is nearly always a kit component that is never sold on its own — the intake pipe *only*, the two intake gaskets, the cutting jigs. Counting those as dead capital was noise: they were \$47.6k of July's \$114.7k of "dead stock" and there was nothing anyone could do about them. They're still reported, as their own line marked **excluded**, so the money is visible — they just no longer distort dead stock, ageing or the slow-mover list.

The lists, and what to actually do with them

List	What it's telling you	Action
Top movers (units) and Biggest margin earners	What shifted, and what paid. These are usually <i>different</i> SKUs	Keep the margin list stocked first
Where the money is sitting	Held value grouped by how recently it last sold, over the stock that has sold at least once	Anything in over a year is a clearance or write-down conversation
Slow movers	Where the capital is stuck — ranked by capital at risk, meaning the value held beyond 90 days of that SKU's own selling rate. A SKU is listed if nothing sold in the 90 days to month end, <i>or</i> it still sells but holds over 180 days of cover with more than \$2,000 past that mark	This is the list to work first. A SKU can be selling every week and still be the worst offender: in July the three biggest were all steady sellers carrying a year of stock — \$67k, \$67k and \$60k tied up. Buy less of them next time, or clear the excess
Stock position	Six months of sales, month by month, against what is on the shelf now. Over 6 months of cover reads <i>Overstocked</i> , under 1 month <i>Short</i> , and a SKU that hasn't sold in six months says <i>No sales</i> . Anything to act on is listed first	The over/under-stocking answer. The monthly columns are there so you can see <i>why</i> : four steady months then nothing is a different problem from one big month and five quiet ones
Reorder suggestions	Only SKUs on the Stock Order sheet — kit components that aren't sold separately are deliberately left out. Flagged when below the MYOB alert level, or under 60 days cover on something that moves. Quantity targets 90 days and respects MOQ; cost uses last price paid	This is the month's buy list. If something you order isn't listed, add it to the Stock Order sheet — the report only suggests what's on there, and it tells you how many off-sheet items it skipped
Sold while out of stock	Demand you couldn't fill on the spot	Raise the alert level on those SKUs
Sold below cost	Selling price ex GST is under average cost	Fix the price, or find out why it was discounted
Cost creep	Last paid is more than 10% above average cost — the buy price moved and the sell price probably didn't	The price-review list. Quietly the most valuable table in the report
Overstock	More than a year of cover at current run rate	Money you could get back

Two things to know before quoting any of it

- **The on-hand figures are read when the report runs, not at midnight on the last day of the month.** MYOB can't give a historical quantity. The 2nd-of-the-month timing keeps the gap small, and the report prints the exact read time on its face.
- **Everything is measured as at the end of the reported month.** Sales made after it don't count, so re-running an old month always gives the same answer. The **Sold since** column on the slow-mover and never-sold lists shows what has moved *since* the month closed — so a part that looks like dead capital but has a number in that column is selling again, and can be left alone.
- **Margin is indicative, not the P&L.** It's units multiplied by *current* average cost, because invoice lines don't carry the cost of sale. It ranks SKUs honestly and finds leakage — but don't reconcile it to the accounts and don't expect it to match the year-end figures.

Who can see it. Admins and managers with stock access. It carries costs, margins and supplier pricing, so a reports-only login can't open it — that's deliberate, not a bug.

Avg/mo is measured from a SKU's first selling month, not the whole window (26 August 2026). A line that has only been out a month is no longer averaged across months it did not exist in. JA-VD300-1BB sold 7 in July on a six-month window: it read **1.17 a month** and now reads **7.00**, a six-fold difference on the number reorder decisions lean on.

Where the window is shortened the report says so beside the figure — **"(from 2026-07, no earlier sales)"** on screen and in the email, a * with a footnote in the PDF — so you can see at a glance which averages rest on one month rather than six.

Growth is left blank for those lines, not shown as a big percentage. There is no earlier period to compare against, and "up 100%" against months a product did not exist in is noise.

The **Units** column in Top movers and Margin earners is now labelled **Sold units**, which is what it always was.

⚠ Old reports keep their old figures until rebuilt. The screen, the PDF and the email all serve the stored snapshot, so July's report still shows 1.17 for that SKU. Press **Rebuild from MYOB** on any month you want recalculated the new way.

9. Tasks, projects and messages

- **Tasks** — board and list views, with automations you draw as a flow diagram.
- **Projects** — the Monday "Hidden To Do" boards as a linked web; comments post back to Monday.
- **Messages** — internal chat, channels and DMs.

9a. Leave applications — the applicant is emailed automatically

Staff apply for leave on the Monday **Payroll & Leave Applications** board (the Leave Request form drops the application into the **Leave Applications** group). Since 24 August 2026, **setting the Leave Approved column to Approved or Denied emails the applicant** — a plain, friendly note with the leave type, dates and total days. Ryan is copied on every one and is the reply-to, so replies land with HR.

For managers approving leave

- Approve or decline in the **Leave Applications** group as you always have. The email goes out within 15 minutes. You don't need to send anything yourself, and you don't need to tell the portal.

- **⚠ Notes you key straight into the payroll groups are never emailed.** "Kaleb left at 11am", "Public Holiday", "Easter Monday – all staff" and the export row all sit on this board marked Approved, and none of them mail anybody. Only an item that was in **Leave Applications** and had Approved (or Denied) pressed on it counts. If you want someone told, decide it on their application, not on a note.
- Changing your mind is fine: flipping an item from Approved to Denied (or back) counts as a new decision and sends the matching email once.
- **Declines are sent too.** The wording asks the person not to take the leave and to speak with their manager — so if you decline something you've already discussed face-to-face, expect them to receive that note as well.

When the portal doesn't know someone's email address

Applications submitted through the form carry an address. Rows a manager types by hand usually don't, so the portal falls back to a staff directory — and if it still can't work out an address, **it emails Ryan once** with the applicant's name and does nothing else.

To fix one (either way works, and the email then goes out at the next 15-minute run — **don't re-approve anything**):

1. fill in the **Email Address** column on the Monday item, or
2. add the name to **Settings** → **Leave Notifications** → **Staff directory**, exactly as it's typed on the board.

Settings → **Leave Notifications** (admins) also holds: the on/off switch, the HR address that's copied and replied to, everything waiting on an address, the last 100 decisions with who was emailed, and two buttons — **Dry run** (works out who *would* be emailed and sends nothing — use this after editing the directory) and **Run now**.

Two deliberate refusals worth knowing about, because they look like faults:

- A **misspelt company address** on the item (there's a live row reading `justaustos...`) is **not** used — that mail would bounce into a void while everyone believed the person had been told. It goes to the unresolved list instead.
- A name the portal can't pin to one person — a bare "Matt" (Huddy, Smith or Karger?), or a row naming several people — is **left unresolved rather than guessed**.

10. When something looks wrong

Work down this table before escalating. Most of these are a stalled worker, not lost data.

Symptom	Most likely cause	Check
Letters or labels stop printing	The print PC is off, asleep, or off the network	PORTAL-CENTRE in the comms room. Failed jobs can be re-queued (failed → pending).
A label prints to the wrong printer	The Apeos (Copy 1) name suffix	⚠ Never trust that suffix — check the real printer name.
Calls stop appearing	The PBX sync worker	Admin → Connections, look at <code>freepbx_cdr_sync</code> freshness
Transcripts stale but calls fine	The transcription worker	Same page; then the PBX box

Symptom	Most likely cause	Check
One long call missing, everything else fine	Not a sync outage — the CDR row arrives only when the call hangs up, so very long calls can land behind the sync window	Note the caller's number and roughly when they rang, and give both to whoever maintains the PBX — the call can be backfilled from the phone system. Connections will look healthy, so don't chase it there
Live monitor says "not configured"	Monitor hasn't reported in >20s	Same page
Dashboard figures look stale	Overnight cache refresh	The 02:00 refresh cron, then the health page
Workshop map or vehicle trend looks out of date	The nightly MD pull	Reports → Workshop Map shows "synced"; "Pull from MechanicDesk now" forces it (~2–4 min)
A pallet quote looks far too cheap for the size of the order, or the goods clearly won't fit the pallet on the plan	Before 27 Aug 2026 pallets were counted by weight alone and chosen without checking the goods fit the deck	Fixed — the order is boxed first and pallets are filled by weight <i>and</i> space. If it still looks wrong, check the pallet's deck size and max weight in Settings → Freight packaging (\$4.3a): the weight you enter is taken literally.
An item shows as its own consignment next to the pallets	It won't sit on the deck in any orientation, so it isn't pretended onto one	Correct behaviour, not a fault — pack and label it as the separate item the carrier is expecting.
A distributor says they never got tracking	Ship Now hasn't been pressed	\$4.2
An AP invoice never arrived	Supplier sent a link, not an attachment	\$5 — link-only emails are invisible
A supplier emailed an invoice, the email is sitting in accounts@, but it never appeared in MYOB or as a card	Until 28 Aug 2026 a PDF the reader choked on was filed as "not an invoice" - no card, no reason, and never looked at again	Fixed: it now retries three times and then posts a red card naming the file and the reason. If it happens on an OLDER email, forward it to accounts@ again - a forward is a new email, so it gets a fresh run
A red card says <i>Couldn't read an attachment</i>	The PDF could not be parsed after three tries - corrupt, password-protected, or an image with no text	Enter that one by hand. If the supplier can resend a normal PDF, forwarding it in re-runs it automatically
A Red Energy bill flags instead of posting, saying the amount was corrected	Deliberate. Their total is before the solar feed-in credit; the portal reads the printed <i>amount due</i> and posts that instead	Check the figure against the bill and approve. It flags every time on purpose for now - tell Chris once you are happy it is right and it can post on its own
An AP Slack card is still orange but the bill is in MYOB	Somebody entered it by hand; the automation has no way of knowing	Press  Entered manually? on the card — it finds the bill, links it and turns the card green (\$5.2)
A weekly email report shows a count that is clearly too low — or zero	A report query that has outgrown the database's 1000-row response cap and is silently dropping the rest	Don't assume the underlying data is missing — check the live screen (Reports → Workshop Map, Reports → Sales Report) for the same period first. If the screen is right and the email is wrong, it's the report, not the workshop. Tell Chris.

Symptom	Most likely cause	Check
Someone approved leave and the person says they got nothing	Either the item wasn't on the application path (a note keyed into a payroll group — §9a), or the portal has no address for them	Settings → Leave Notifications: the item will be under "Waiting on an email address" if it's an address problem. If it isn't listed at all, the decision was made on a note rather than an application.
Ryan gets "no email address for ..." notices	The applicant's name isn't in the staff directory and the item has no Email Address	Add either one (§9a) — the email then sends itself; nobody needs to re-approve. You only get that notice once per application.
Stock EOM figures look stale or wrong	The report shows a stored snapshot, so it's frozen at whatever time it was generated	Reports → Stock EOM → Rebuild from MYOB . If the on-hand looks off by a few days' trading, that's expected — see §8.9
Dead stock drops sharply between two months	Months before September 2026 counted never-sold kit parts as dead stock; from 25 Aug 2026 they're excluded	Not a data loss — the old month is on the old basis. Reports → Stock EOM → pick that month → Rebuild from MYOB restates it so the two compare like for like
The month-end stock email didn't arrive on the 2nd	Either the MYOB connection or the recipient list	Admin → Connections for MYOB health, then Reports → Stock EOM → Email this report to send it by hand
The Slack parts bot says it can't find a part you know is in stock	The 30-minute stock sync was interrupted part-way and cached only some of the catalogue	Fixed 2026-08-27 — the sync now refuses to save a partial catalogue and keeps the last good one instead. If it happens again the bot's numbers will be <i>stale</i> rather than missing, so check when it last synced and tell Chris. Don't re-count the shelf over it.
A stocktake row shows a negative system QTY (e.g. -1) when the part is really at zero	A part committed or sold against stock that hasn't arrived yet. Until 28 Aug 2026 that read through to the count sheet, painting the row red for a discrepancy that isn't real	Fixed — the system QTY is never negative now; it shows 0, and the variance goes with it. On a count sheet from before that date, press Refresh system quantities (or Run Match) and the red rows clear. Note the QTY inside MechanicDesk's own stocktake keeps the old figure until the count is pushed again
A stocktake count is short and nobody can explain it	Parts fitted to cars on jobs that haven't been invoiced — MD still counts them as on-hand	Stocktake (MD) → the On cars panel. Use its Should count column as the target, not MD's on-hand. If it's stale, press Check Mechanics Desk first
Conversion % suddenly looks much better than you expected	Include distributor jobs is switched on — those jobs never had a workshop quote	Reports → Workshop Map → Conversion. Switch it off to see the workshop's own conversion; the <i>of which dist.</i> column shows what it was adding
Ship now fails with "CompanyId is required"	The portal could not work out which MachShip account owns the consignment	Fixed 2026-08-27 — it now reads that from the order itself. If it ever returns, the message will name what to do: set the fallback in Admin → B2B → Settings, or re-book the freight. Do not keep pressing Ship now — each attempt is a fresh manifest attempt
Someone can't see a tab	Permissions, working as designed	Ask Chris

Where to look first, always: Admin → Connections. It shows every integration and when it last succeeded.

11. Housekeeping (admins)

Task	Where
Read or download this document and the handover	Admin → Library (/admin/library) — Settings → Library tile, or your name → Settings → Library
Show someone how to get to the Library	Send them <code>docs/library-access-sop.pdf</code> — an illustrated one-pager with screenshots of every step (kept in the repo, not on the Library shelf)
Add a person, set their role and tabs	Settings → Users
Clear someone's 2FA	Settings → Users
Change an integration's credentials	Admin → Connections / Settings → Integrations — ⚠ always here, never by editing environment variables directly
Check every integration's health	Admin → Connections
Per-person reply-to address on outgoing mail	Settings → Users
Leave approval emails — switch, HR address, staff directory, who was emailed	Settings → Leave Notifications (§9a)
Who gets the month-end stock email	Settings → Integrations → <code>JAWS_EOM_EMAIL_TO</code> (comma-separated)

Appendix — the golden rules

1. **Book Freight prepares. Ship Now despatches.** Nothing goes to the carrier and no tax invoice exists until Ship Now.
2. **Ship a despatch run in one action** — one manifest, one pickup.
3. **"Sales" in the weekly recap means orders, not turnover.**
4. **A never-quoted lead is not a lost quote.**
5. **Counted stocktake rows are sacred** — investigate before applying a variance.
6. **Check "On cars" before chasing a stocktake variance** — parts fitted to cars in the shop are still on MD's books. A short shelf is usually the answer, not a problem.
7. **Boxes first, then the deck.** On a palletised order pack each box from the pick list, then load the boxes onto the pallet — and a pallet's max weight in Settings is taken literally, so only enter what the carrier and the forklift will really take.
8. **The workshop runs on Mechanics Desk** — the portal handles parts, letters, counting and reporting around it.
9. **Credentials change in the portal**, not in environment variables.
10. **Reload when the new-version banner appears.**
11. **Leave is approved on the application, not on a note.** Pressing Approved on an item in Leave Applications emails the applicant; a line typed into a payroll group emails nobody.
12. **Check "Entered manually?" before approving an AP flag card** — approving one that was already keyed in by hand posts the bill twice.
